```python
from IPython.display import Image
from IPython.core.display import HTML
```

```python
# Connect to google drive
import os
from google.colab import drive
drive.mount('/content/drive')

# content in your drive is now available via "/content/drive/My Drive"
```

Drive already mounted at /content/drive; to attempt to forcibly remount, call drive.mount("/content/drive", force_remount=True).

```python
# Import data and unzip files to folder
!unzip /content/drive/MyDrive/COVID-19_Radiography_Dataset.zip
```

## 1.2  1. Dataset and Exploratory Data Analysis

Start by describing the dataset. Include basic statistics and image samples to show the types of images available (e.g., COVID-positive and negative chest x-rays).

Check if the dataset is balanced across classes. If it's imbalanced: Discuss potential strategies such as class weighting, oversampling, undersampling, or augmentation. Indicate which method you chose, and discuss how model performance changed as a result.

Reflect on the practical value of this classification task. Who might benefit from your model in a real-world setting?

```python
# Extracting all filenames iteratively
base_path = 'COVID-19_Radiography_Dataset'
categories = ['COVID/images', 'Normal/images', 'Viral Pneumonia/images']

# load file names to fnames list object
fnames = []
for category in categories:
    image_folder = os.path.join(base_path, category)
    file_names = os.listdir(image_folder)
    full_path = [os.path.join(image_folder, file_name) for file_name in␣
  ↪file_names]
```

```
    fnames.append(full_path)

print('number of images for each category:', [len(f) for f in fnames])
print(fnames[0:2]) #examples of file names
```

number of images for each category: [3616, 10192, 1345]

The dataset is the COVID-19 Radiography Dataset, which includes chest X-ray images across three categories:

COVID-19 positive

Normal (no pneumonia)

Viral Pneumonia (non-COVID).

The original dataset was significantly imbalanced: Class Image Count:

Normal 10,192

COVID-19 3,616

Viral Pneumonia 1,345

Without addressing this imbalance, the model could become biased toward the Normal class, as it dominates the training data. This would lead to poor performance in detecting minority classes like COVID and Viral Pneumonia — which is unacceptable in a medical setting.

Besides manually reduced to an equal number of images per class (1,344 each), we use class weighting to adjust the imbalance.

```
[ ]: class_labels = [0, 1, 2]   # assuming: 0=COVID, 1=Normal, 2=Viral Pneumonia
     class_counts = [3616, 10192, 1345]

     # Repeating each label for the number of samples it has
     y = np.array([label for label, count in zip(class_labels, class_counts) for _
       ↪in range(count)])

     class_weights = compute_class_weight(class_weight='balanced', classes=np.
       ↪unique(y), y=y)
     class_weight_dict = dict(zip(class_labels, class_weights))

     print(class_weight_dict)
```

{0: np.float64(1.3968473451327434), 1: np.float64(0.49558477237048665), 2: np.float64(3.755390334572491)}

Using the original untrimmed dataset preserves valuable data, while class weighting corrects for imbalance, helping the model avoid always predicting the majority class.

There are other potential strategies such as oversampling, undersampling, or augmentation.

Oversampling: Duplicate images from minority classes to match the majority. Risk of overfitting.

Undersampling: Reduce the majority class (Normal) to match the size of minority classes. Risk of losing valuable data.

Data Augmentation: Generate synthetic images (e.g., flips, rotations) to enrich minority classes. Helps prevent overfitting.

To prevent the model from becoming biased toward the Normal class (which has the most samples), we can reduce each category to 1,345 images — the minimum across all classes. This ensures class balance, which is critical for fair and reliable training.

```
[ ]: #Reduce number of images to first 1345 for each category

     fnames[1]=fnames[1][0:1344]
     fnames[2]=fnames[2][0:1344]
```

```python
# Write preprocessor that will match up with model's expected input shape.

Real-World Value: This classification model has significant practical value on healthcare profession-
als, clinical decision support and publich health. It can assist radiologists in triaging chest X-rays
quickly, especially during pandemic surges. Useful in prioritizing further testing (e.g., PCR) or
treatment based on X-ray findings. And it can help with tracking and early detection of viral
pneumonia trends. Clinicians and radiologists benefit from this, this model can serve as a real-
time second opinion, helping flag likely COVID cases early, differentiate between COVID and
other pneumonia, and prioritize critical patients faster. It can also be a baseline for future models
trained on multimodal inputs (e.g., combining X-ray with symptoms/labs), and broader disease
classification (e.g., tuberculosis, lung cancer).

## 1.4   3. Transfer Learning with ResNet

Implement ResNet using transfer learning.

Fine-tune the model and compare its performance with the baseline CNN.

Discuss how using pre-trained features influences your model's training and generalization.

```
from tensorflow.keras.applications import ResNet50
from tensorflow.keras.layers import GlobalAveragePooling2D
```

```python
# Load pre-trained ResNet50 (exclude top layer)
base_model = ResNet50(weights='imagenet', include_top=False, input_shape=(128,
 ↪128, 3))

# Freeze all layers
for layer in base_model.layers:
    layer.trainable = False

# Add custom classifier on top
x = base_model.output
x = GlobalAveragePooling2D()(x)
x = Dense(128, activation='relu')(x)
x = Dropout(0.5)(x)
predictions = Dense(3, activation='softmax')(x)  # 3-class output

### 1.4.1 Comparison with Baseline CNN

| Model | Train Acc | Val Acc | Test Acc |
|---|---|---|---|
| **Baseline CNN** | 89.00% | 89.70% | 89.60% |
| **ResNet50 TL** | 89.60% | 89.77% | 89.63% |

Using transfer learning with ResNet improved model generalization. The pre-trained network brought in rich feature representations learned from millions of natural images, which helped the model: converge faster (with fewer epochs), achieve comparable validation and test performance to the baseline CNN, leverage pre-learned low-level features (e.g., edges, textures) while focusing training on high-level classification.

Although no large improvement over the baseline was observed, this outcome demonstrates that even with a simple frozen ResNet backbone, models can generalize well to new domains like medical imaging. Further gains could be achieved by fine-tuning the top few layers of ResNet.

```python
# Fine tune the model
# Unfreeze last 10 layers
for layer in base_model.layers[-10:]:
    layer.trainable = True
```

```python
#recompile the model
model_resnet.compile(
    optimizer=Adam(learning_rate=1e-5),  # Lower LR for fine-tuning
    loss='sparse_categorical_crossentropy',
    metrics=['accuracy']
)
```

```python
#continue training
history_resnet_ft = model_resnet.fit(
    X_train, y_train,
```

```
        validation_data=(X_val, y_val),
        epochs=5,
        batch_size=16,

Fine-tuning the last few layers of ResNet50 after feature extraction did not lead to a significant improvement in validation or test accuracy. This indicates that the pre-trained ResNet50 features were already highly transferable to our medical imaging dataset.

Fine-tuning slightly adjusted the high-level feature representations without overfitting, suggesting that our training setup — with a small learning rate and limited layers unfrozen — effectively preserved the generalization ability of the model.

In future work, fine-tuning a larger portion of the network or applying data augmentation might further boost performance, especially when more training samples are available.

# 2 4. Additional Architectures

Implement three additional models of your choice.

Use consistent data splits and preprocessing across all models to ensure fair comparison.

We used a classic deep model (VGG16), a parameter-efficient model (DenseNet121), and a lightweight model optimized for speed (MobileNetV2).

Evaluate all models on the same test set.

Highlight the model that achieved the best test performance.

Summarize the key hyperparameters and training strategies for each model(e.g., learning rate, batch size, number of epochs, optimizer).

Include plots such as training/validation loss and accuracy over epochs.

Test Set Evaluation:

All models were evaluated on the same test set (X_test, y_test), ensuring a fair comparison of their generalization performance.

Overall Training and Validation Curves Summary For all models evaluated (Baseline CNN, ResNet50, VGG16, DenseNet121, MobileNetV2), training and validation accuracies steadily increased over the 5 epochs, with minimal signs of overfitting. Validation accuracies remained relatively stable and close to training accuracies across all models.

This suggests that:

The dataset is sufficiently clean and well-separated for CNNs to generalize well. Transfer learning with pre-trained feature extractors (even without extensive fine-tuning) provides robust performance across architectures. Differences in model depth, parameter size, and design had limited impact under the current settings (128x128 inputs, small number of epochs). Overall, the training behaviors across models were consistent, highlighting the strong generalization of pre-trained CNNs even with limited medical imaging data.

Final Observations:

ResNet50 and VGG16 both achieved the highest test accuracy (~89.63%), confirming the strong transferability of pre-trained features. DenseNet121 and MobileNetV2 also performed competitively, despite having fewer parameters and faster training times. Fine-tuning the last few layers of ResNet50 showed minimal improvements, suggesting that pre-trained features were already highly optimized for this task. Future improvements could involve fine-tuning larger portions of the models or applying advanced data augmentation techniques to further differentiate architecture performance.

# 4  6. Augmentation

For at least one model, re-train it using data augmentation techniques.

Describe the types of augmentations used (e.g., flipping, cropping, rotation) and how they affected performance.

```python
#clear RAM
gc.collect()
tf.keras.backend.clear_session()
```

```python
# Data Augmentation Training for MobileNetV2 Model
from tensorflow.keras.preprocessing.image import ImageDataGenerator

# Define ImageDataGenerator with data augmentation
train_datagen_aug = ImageDataGenerator(
    rotation_range=15,        # Randomly rotate images by up to 15 degrees
    width_shift_range=0.1,    # Randomly shift images horizontally by 10%
    height_shift_range=0.1,   # Randomly shift images vertically by 10%
    horizontal_flip=True,     # Randomly flip images horizontally
    zoom_range=0.1            # Randomly zoom images by up to 10%
)

# Validation data generator without augmentation (only rescaling if needed)
val_datagen = ImageDataGenerator()

# Create generators
train_generator = train_datagen_aug.flow(X_train, y_train, batch_size=16)
val_generator = val_datagen.flow(X_val, y_val, batch_size=16)
```

```python
# Clear previous models and memory

tf.keras.backend.clear_session()

# Load pre-trained MobileNetV2 without top layers
base_model_mobilenet_aug = MobileNetV2(weights='imagenet', include_top=False,

Data Augmentation Results:

For MobileNetV2, we retrained the model using data augmentation techniques including:

- Random rotation ($\pm 15$ degrees)
- Horizontal flipping
- Random zooming (10%)
- Width and height shifts (10%)

After applying augmentation:

- Original Test Accuracy (no augmentation): 89.32%
- Augmented Test Accuracy: 89.94%

This improvement suggests that data augmentation enhanced the model's generalization by exposing it to more diverse training examples, effectively reducing overfitting and leading to better test performance.

# 5  7. Interpretability & Insights

Reflect on which model performed best and why.

Provide clear reasoning, supported by performance metrics and training curves.

Conclude with a discussion of the practical utility of your best-performing model.

Who would benefit from using this model?

In what types of real-world scenarios would your solution be useful?

7.1 Best-Performing Model

The best-performing model was MobileNetV2 trained with data augmentation, achieving a test accuracy of 89.94%.

Compared to other models:

- Baseline CNN, ResNet50, and VGG16 achieved around 89.6%–89.63%.
- DenseNet121 achieved 89.01%.
- MobileNetV2 without augmentation achieved 89.32%.

Training and validation curves for MobileNetV2 (augmented) showed smooth convergence without significant overfitting, indicating effective generalization.

7.2 Reasoning Behind Performance

Several factors contributed to MobileNetV2 (augmented) outperforming other models:

- Efficient architecture: MobileNetV2 is designed for lightweight, efficient feature extraction, making it highly suitable for limited data scenarios.
- Data augmentation: The use of random rotations, flips, zooms, and shifts exposed the model to more diverse training samples, helping it generalize better.
- Small input size: MobileNetV2 handles smaller input sizes (128x128) efficiently compared to heavier models like VGG16.

Thus, the combination of efficient architecture and augmented data helped MobileNetV2 outperform even larger, deeper networks like ResNet50 and VGG16 in this task.

7.3 Practical Utility of the Model

Who would benefit from this model?

- Medical professionals and radiologists, particularly in resource-limited settings (e.g., rural hospitals, mobile clinics), where quick, lightweight diagnostic tools are needed.
- Researchers developing lightweight AI-based diagnostic assistance tools for medical imaging.

Real-world scenarios where this model would be useful:

- Preliminary COVID-19 screening using chest X-rays in environments with limited access to CT scans.
- Rapid triage systems in emergency departments to quickly identify suspected pneumonia or viral infections.
- Telemedicine platforms providing remote diagnostic assistance for chest-related conditions.

Because MobileNetV2 is computationally efficient, it can be deployed on portable devices or cloud servers, making it practical for real-world, real-time applications.
